Risk valuation using ProActive workflows

Basics

Value At Risk (VaR)

One-day 95% VaR of $1 million ⇔ 5% probability that the portfolio worst-case loss will exceed $1 million over a one-day period

Monte Carlo (MC) simulations

$$\widetilde{X_n} = \frac{1}{n}\sum_{i=1}^{n} X_i \xrightarrow{n\to+\infty} \mathbb{E}\,X$$

The Law of Large Numbers states for large *n*, the empirical average is very close to the expected value

Estimating the VaR using MC simulations

$$\mathbb{P}(L_t > x) = \frac{1}{nb\_VaR}\sum_{i=1}^{nb\_VaR} \mathbb{1}_{L_t^i > x} = 1 - \alpha$$

x the portfolio VaR

L_t the porfolio loss at *t*

α the VaR probability

nb_VaR the number of MC simulations

Monte_Carlo_VaR_portfolio.xml

Estimates the Monte Carlo Value at Risk (MC VaR) of a portfolio. We use the geometric Brownian motion (GBM) method to simulate stock price paths, but more exotic assets can be integrated thanks to the Quantlib C++ lib.

Simulation

nbMC	10000	The number of Monte Carlo simulations.
nbTimeSteps	255	The number of time steps to the horizon.
horizon	1	The horizon in year fraction.
assets_params_file_path_from_dataspace	assets.txt	The relative path from the dataspace of the asset params file following the csv format.
assets_correlations_file_path_from_dataspace	assets_correlations.txt	The relative path from the dataspace of the asset correlations file.

VaR

confidenceRate	0.99	The confidence level rate.
nbBins	50	The number of bins for the portfolio estimation distributions.

Parallelization

nbTasks	5	The number of ProActive replicated tasks.

Display

width_chart	1000	The width of the chart in pixels.
height_chart	500	The height of the chart in pixels.
chart_message_to_append		A message to append to the generated chart title.

<start price>, <riskless rate>, <volatility rate>,<weight>

```
20.16,0.2312,0.2116,0.3
40,0.115,0.254,0.3
110,0.6,0.4,0.4
```

```
1 0 0
0 1 0
0 0 1
```

Monte_Carlo_VaR_portfolio.xml

Estimates the number of MC simulations per replicated task. The tasks number does not necessary divide the total number of simulations

Using Quanlib, each replicated task proceses a subset of the MC simulations and deduces the PnL (profit and loss) of each simulated path (value at horizon of a simulation - value at start). On the task side, PnLs are saved into a dedicated file

This task gathers all the PnLs into a single array, sorts them, and retrieves the VaR at the VaR_index corresponding to (1 - confidenceRate) * nbMC. Finally, it generates the corresponding frequencies bar chart and exposes it (view/download)

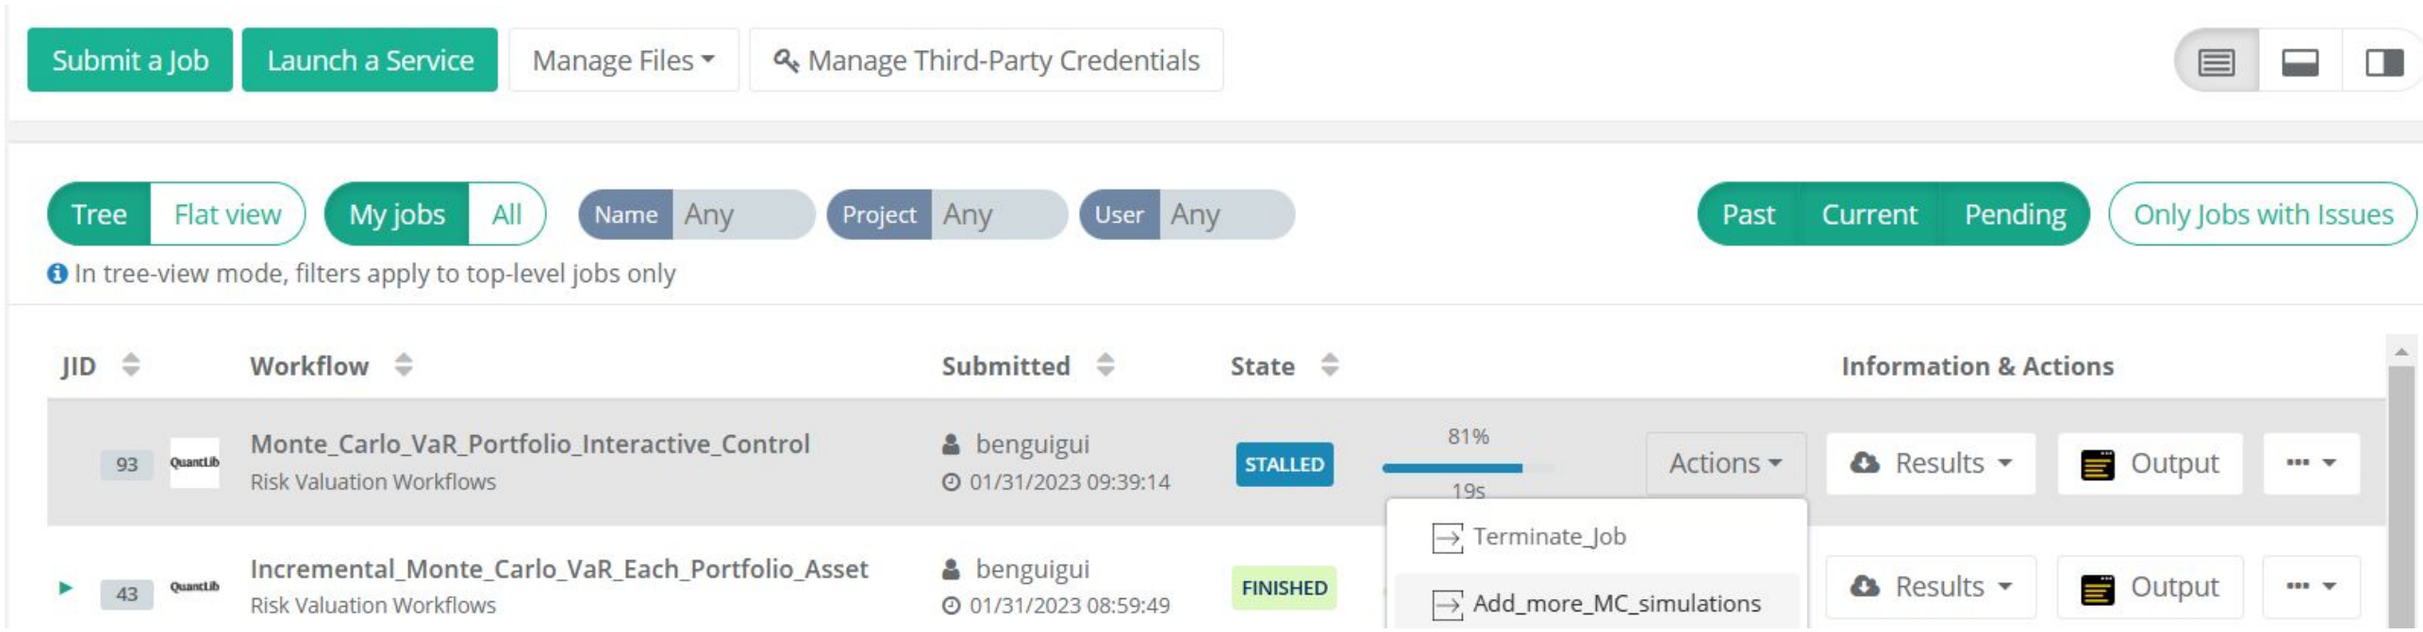
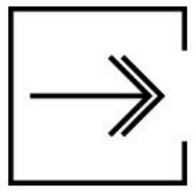
Monte_Carlo_VaR_portfolio_Interactive_Control.xml

The interactive version of the Monte_Carlo_VaR_portfolio workflow allows the user to add more MC simulations to the current results, for a more accurate VaR. “The estimated VaR can be refined incrementally.”



The user will be asked to specify the new MC simulation number to be aggregated to the VaR estimation.



You are about to send signal Add_more_MC_simulations to Job Id 6, Workflow named Monte_Carlo_VaR_Portfolio_MC_Interactive_Control

Main Variables

nb_MC	10000	The number of Monte Carlo simulations.
nb_tasks	5	The number of ProActive replicated tasks.
TARGETED_PA_NODE_SOURCE_NAME	On-Prem-Server-Static-Nodes	The node source where the job will be executed.

Incremental_Monte_Carlo_VaR_Each_Portfolio_Asset.xml

Estimates the incremental VaR (iVaR) for each asset of the portfolio. iVaR quantifies the risk a position (or sub-portfolio) is adding to a portfolio. The iVaR related to an asset Y, is the difference between the portfolio VaR with and without Y.

Simulation

nbMC	10000	The number of Monte Carlo simulations per VaR estimation.
nbTimeSteps	255	The number of time steps to the horizon.
horizon	1	The horizon in year fraction.
assets_params_file_path_from_dataspace	assets.txt	The relative path from the dataspace of the asset params file following the csv format.
assets_correlations_file_path_from_dataspace	assets_correlations.txt	The relative path from the dataspace of the asset correlations file.

VaR

confidenceRate	0.99	The confidence level rate.
nbBins	50	The number of bins for the portfolio estimation distributions.

Parallelization

nbTasksPerVaR	4	The number of ProActive replicated tasks per VaR estimation.

Display

width_chart	1000	The width of the chart in pixels.
height_chart	500	The height of the chart in pixels.

Incremental_Monte_Carlo_VaR_Each_Portfolio_Asset.xml

Estimates the number of MC simulations per replicated task for each VaR (right branch and left branch). The tasks number must divide the total number of simulations

(left branch) This task submits the Monte_Carlo_VaR_portfolio wkw by considering all assets specified by the user

(right branch) **1st level of replicated tasks:** a replicated task per asset (Y)

(right branch) Each replicated task instanciates an asset params files, by excluding an asset from the portfolio, ie setting to 0 the asset weight. Then each task submits the Monte_Carlo_VaR_portfolio wkw (**2nd inner level of replicated tasks**) with an instanciated asset params file as input.

Gather the portfolio VaR over all assets (left branch) and all partial VaRs (right branch). Compute and print the iVaR related to each asset (portfolio VaR estimated by the left branch - portfolio VaR without the asset Y estimated by the right branch)

Stress_Testing_Monte_Carlo_Value_Portfolio.xml

Estimates the portfolio PnLs (Profits and Losses) over stressed risk free rates and volatilities.

Simulation

nb_MC_per_ptf_value	1000	The number of Monte Carlo simulations per portfolio estimation.
nb_time_steps	255	The number of time steps to the horizon.
stress_horizon	1	The stress horizon in year fraction.
assets_params_file_path_from_dataspace	assets.txt	The relative path from the dataspace of the asset params file following the csv format.
assets_correlations_file_path_from_dataspace	assets_correlations.txt	The relative path from the dataspace of the asset correlations file.
stressed_risk_free_rate_in_percent_range_min	-10	The min of the stressed risk free rate range.
stressed_risk_free_rate_in_percent_range_max	+10	The max of the stressed risk free rate range.
stressed_risk_free_rate_range_nb_steps	8	The step number of the stressed risk free rate range.
stressed_volatility_in_percent_range_min	-5	The min of the stressed volatility rate range.
stressed_volatility_in_percent_range_max	+5	The max of the stressed volatility rate range.
stressed_volatility_range_nb_steps	8	The step number of the stressed volatility rate range.

Parallelization

nb_replicated_tasks	4	The number of ProActive replicated tasks which must divide stressed_risk_free_rate_range_nb_steps x stressed_volatility_range_nb_steps.

Others

DOCKER_ENABLED	◉ TRUE ○ FALSE	If true, the workflow tasks will be executed inside a docker container

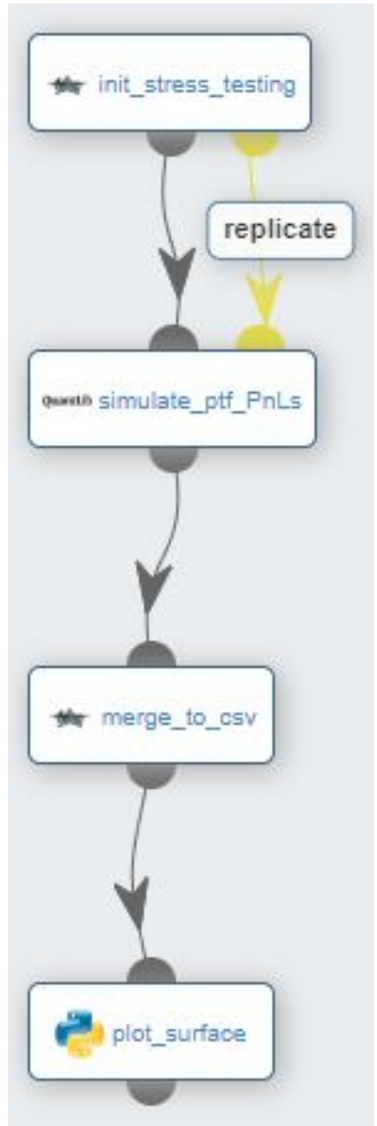
Stress_Testing_Monte_Carlo_Value_Portfolio.xml

Generates all the combinations <stressed risk free rate, stressed volatility> according to their min,max,step user parameters. The number of replicated tasks must divide the number of combinations, i.e. the number of scenarios

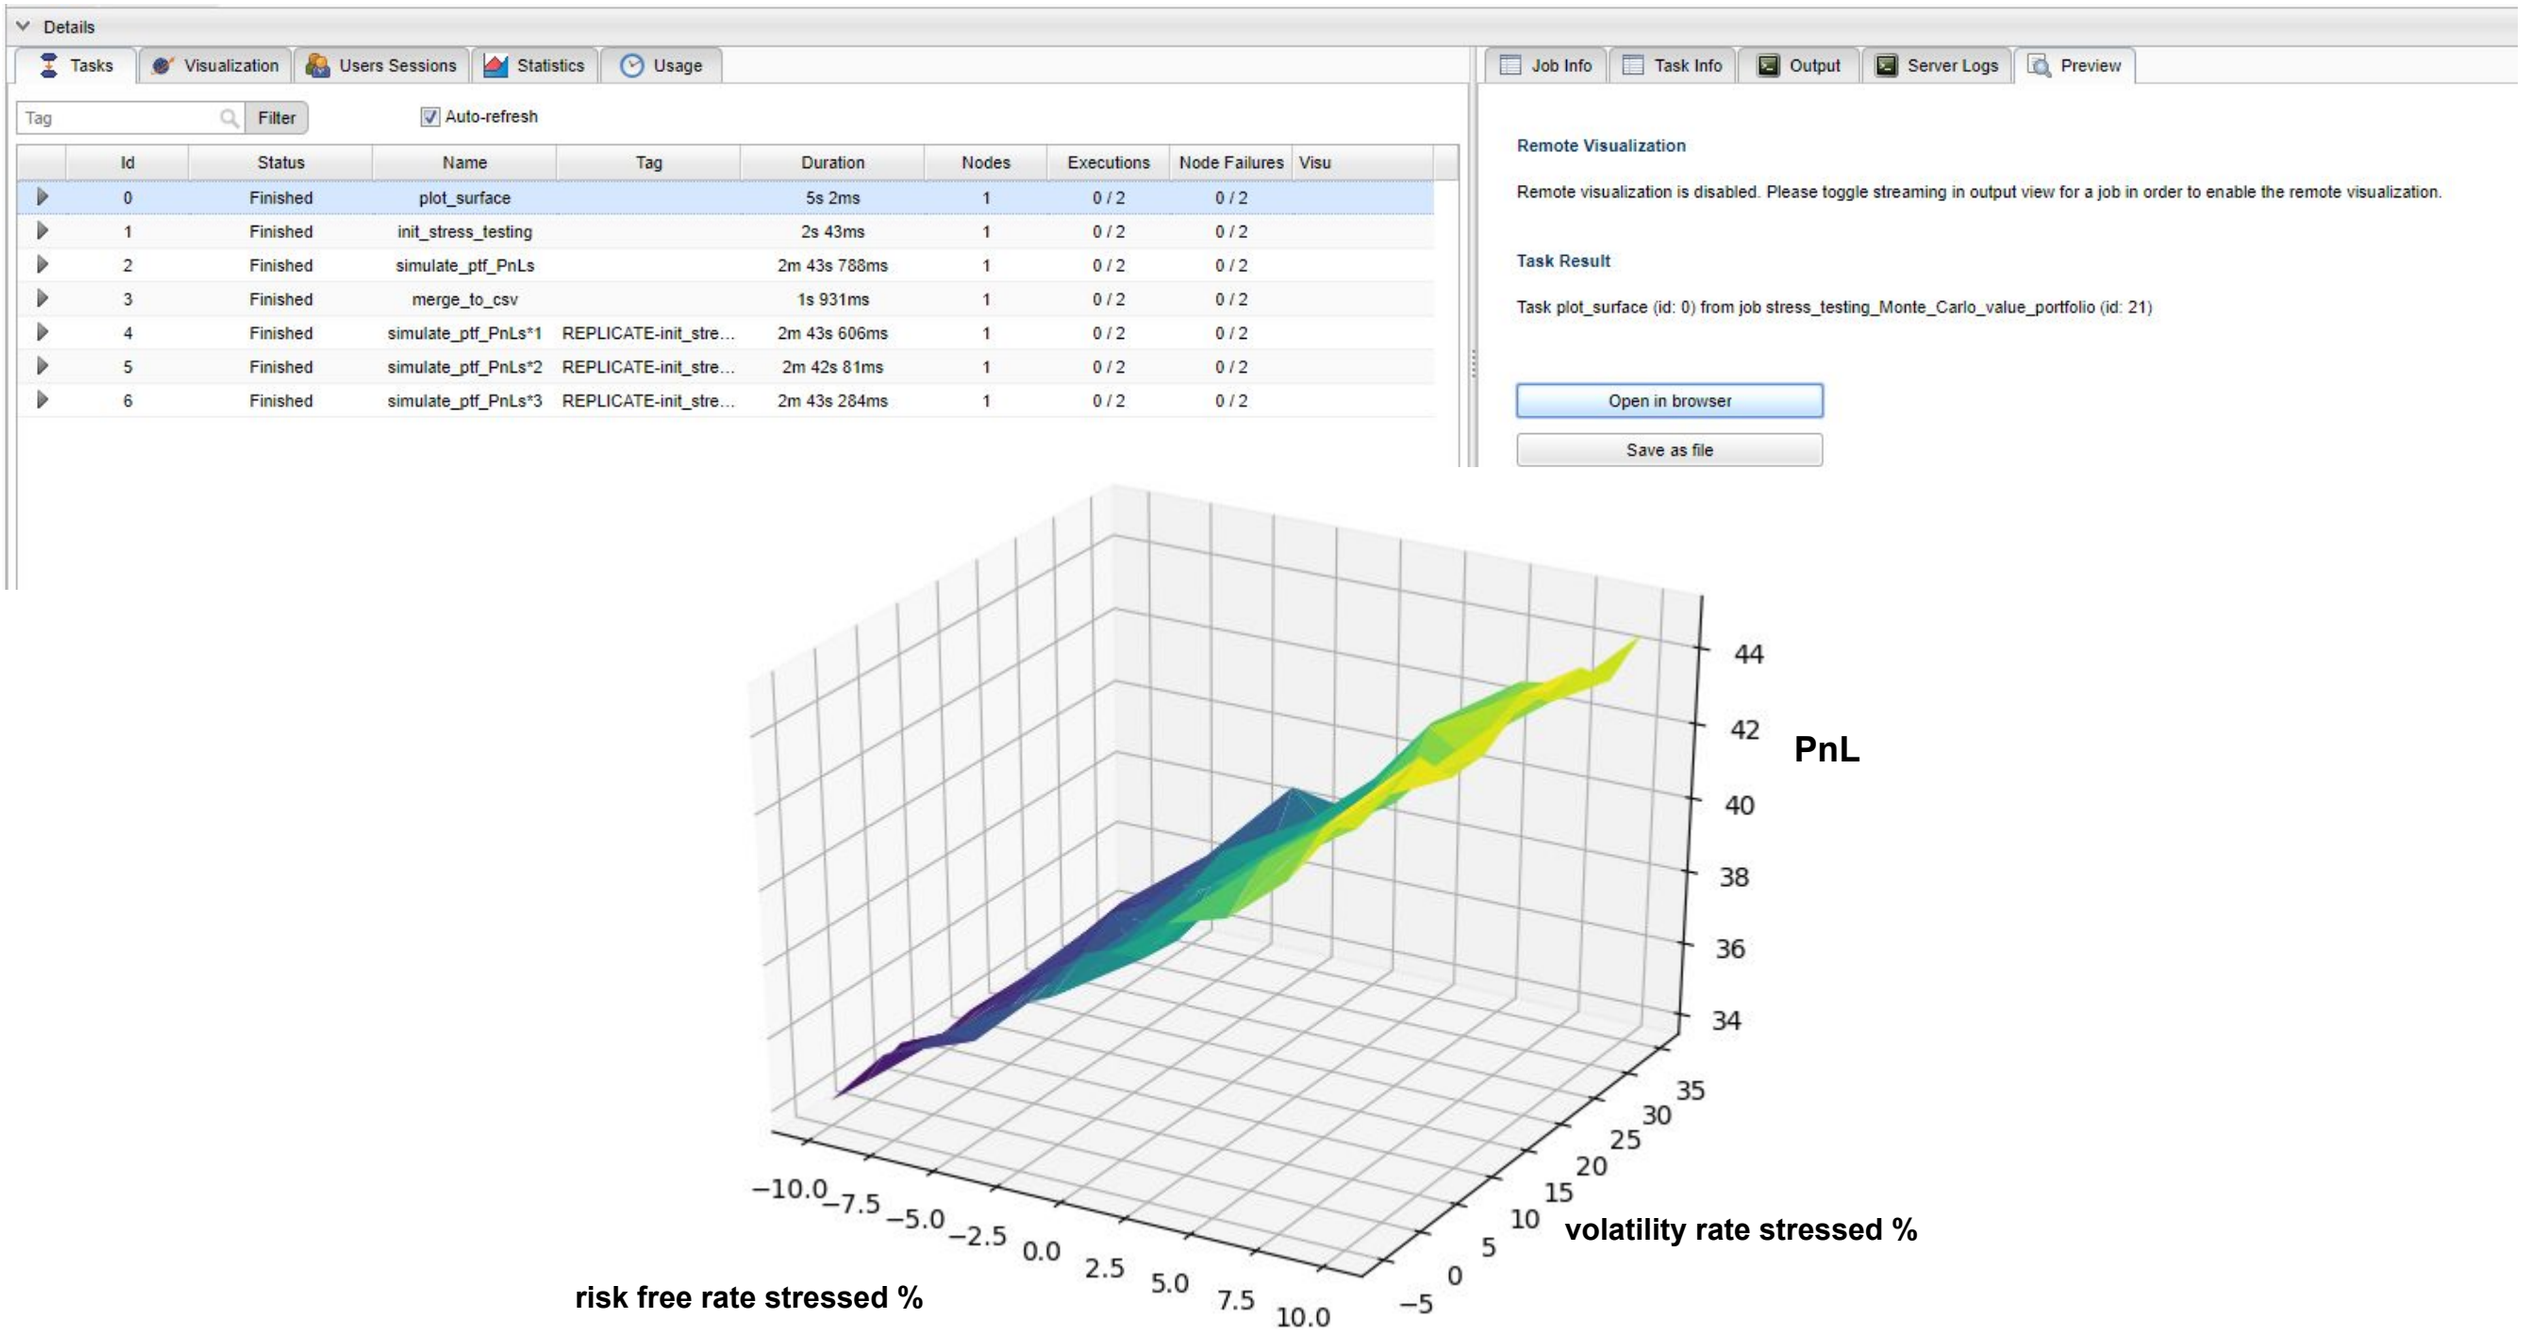
Each replicated task processes a subset of the scenarios and estimates per scenario, the mean/expected portfolio Profit and Loss (P&L) over the given number of MC simulations. These simulations are processed in C++/Quantlib. Each task writes into a dedicated file all its estimated P&Ls (a P&L per senario)

Merge all stressed PnLs into a single csv file

Plot a 3D representation of the stressed PnLs

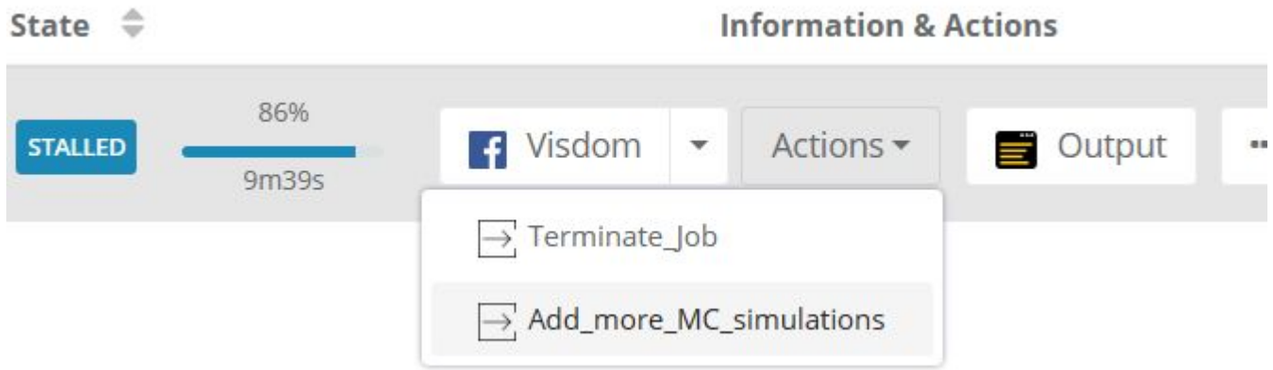


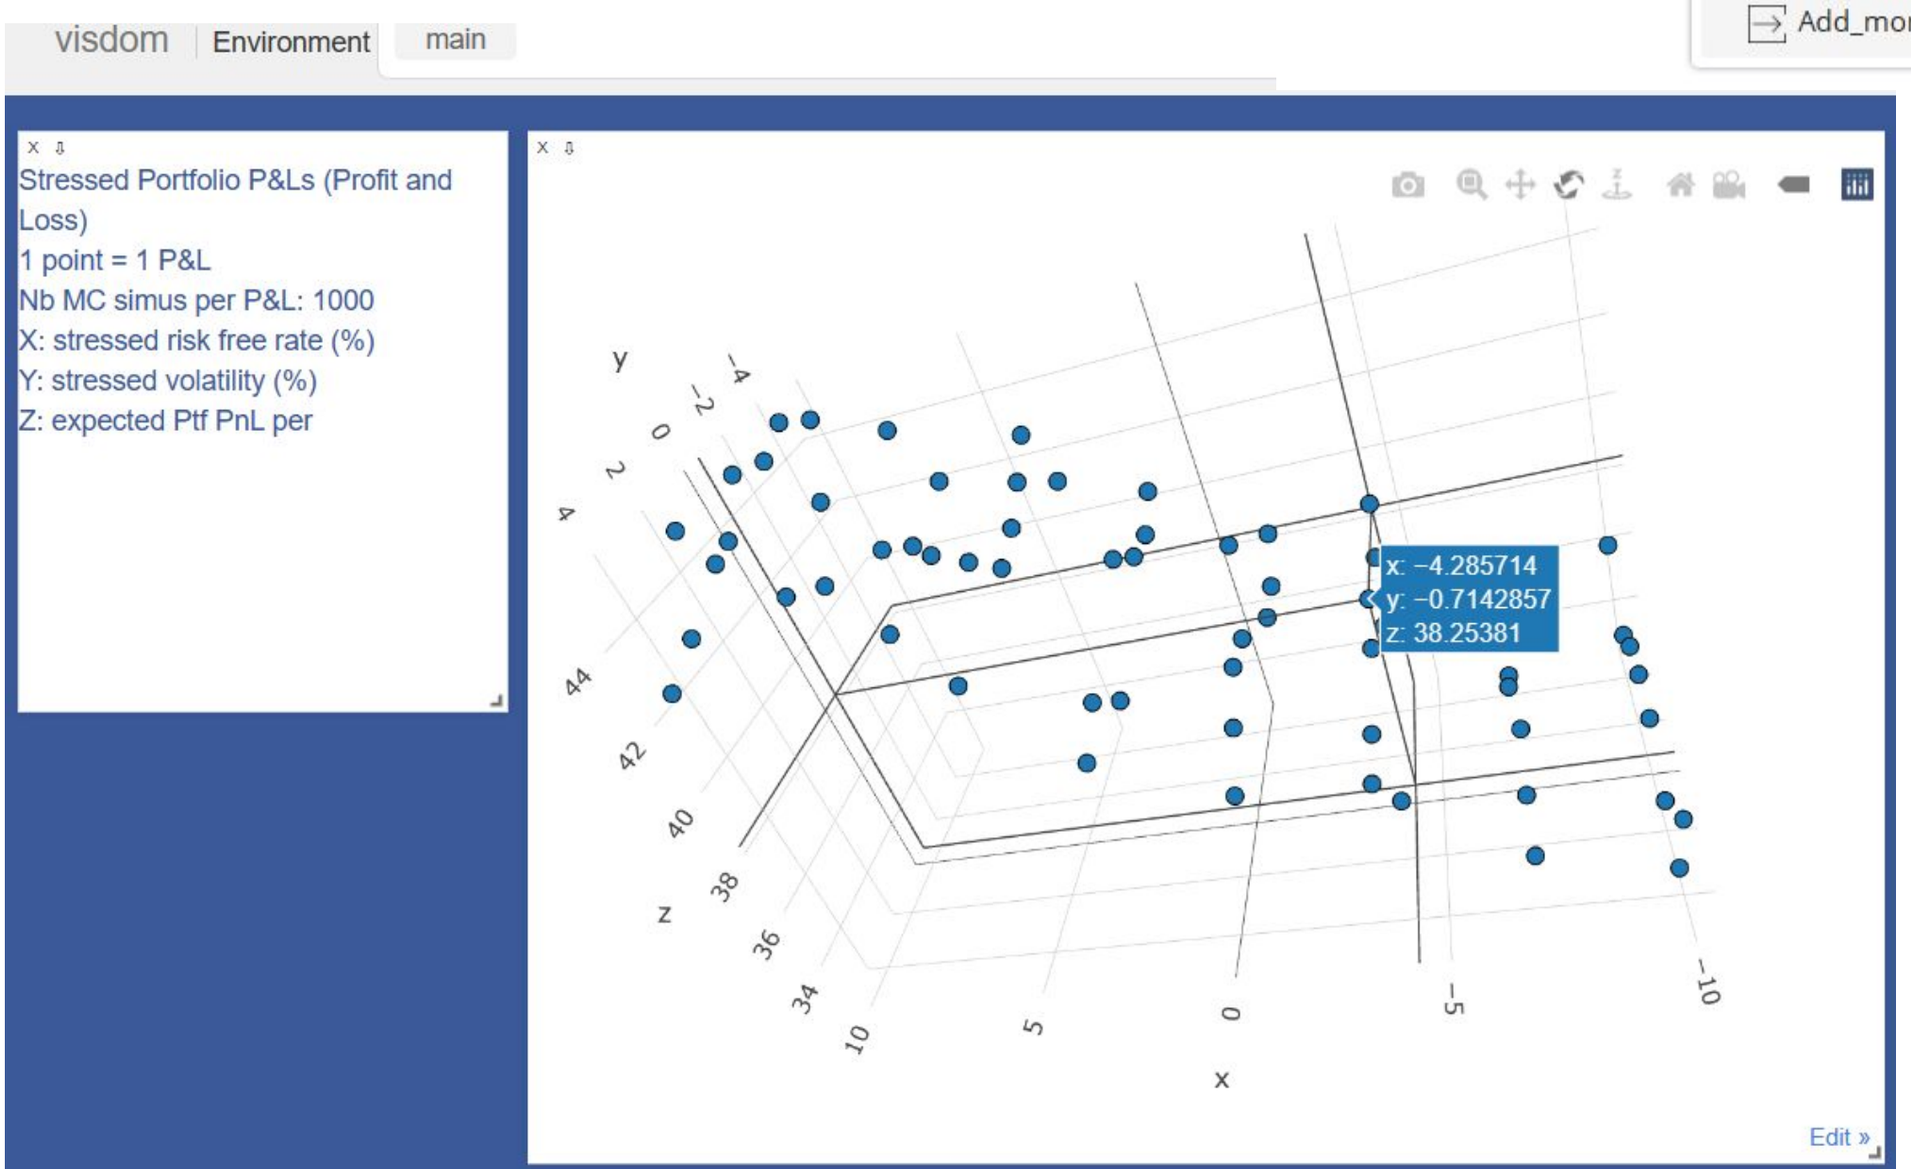
Stress_Testing_Monte_Carlo_Value_Portfolio.xml



Stress_Testing_Monte_Carlo_Value_Portfolio_MC_Interactive_Control.xml

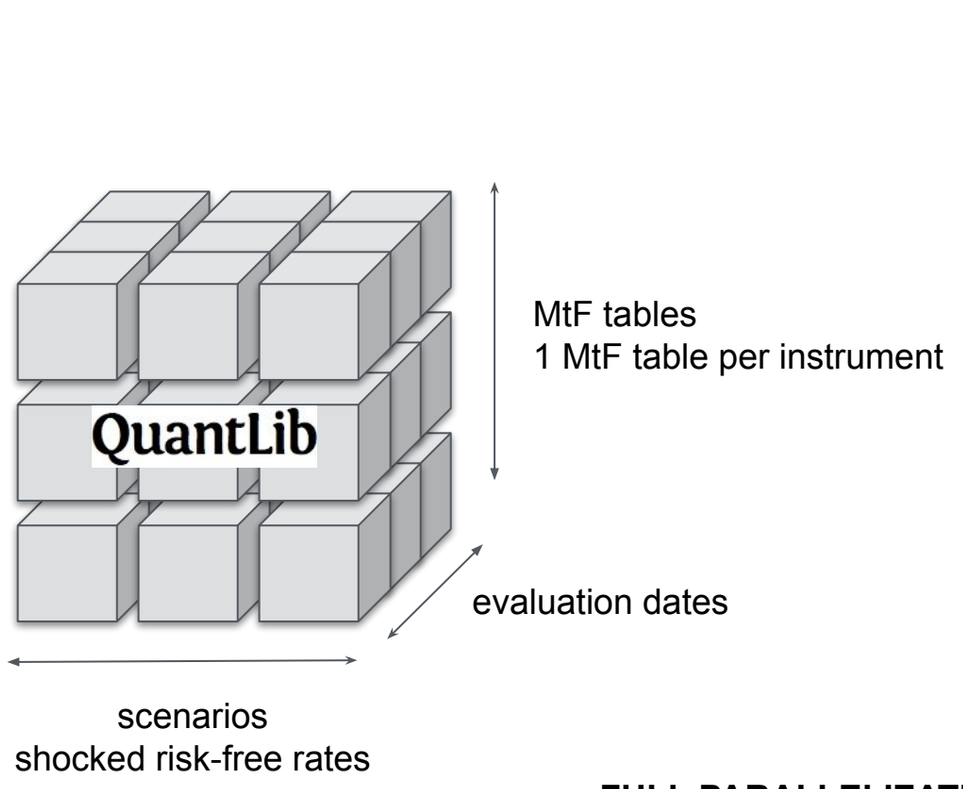
The interactive version of the Stress_Testing_Monte_Carlo_Value_Portfolio workflow allows the user to add more MC simulations to each estimated stressed portfolio P&L.

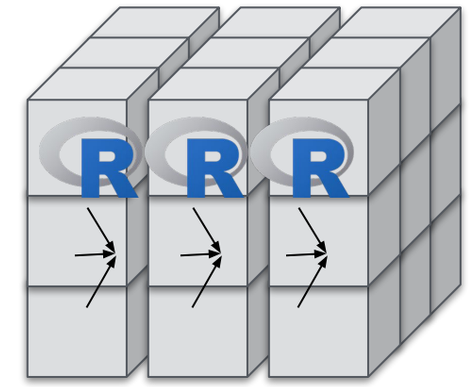




Mark_to_Future_cube_stats.xml

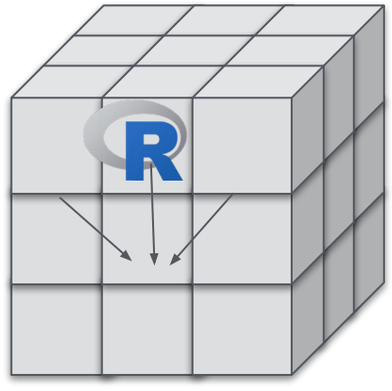
Estimates a Mark-to-Future (MtF) cube of a bond portfolio. Each cell of the cube estimates the valuation of a bond at a specific time given a specific scenario. This can be easily extended to more exotic instruments thanks to the high maintenability of the implementation (C++ Quantlib for the pricing engine, inputs split in Java/Groovy, R for the cube/cubelet stats,..).





REDUCTION BY INSTRUMENTS

FULL PARALLELIZATION OF CUBELETS ESTIMATIONS



REDUCTION BY SCENARIOS

Mark_to_Future_cube_stats.xml

Simulation

evaluation_date_start	01/12/2018	The start date of the evalution.
evaluation_date_end	20/12/2021	The end date of the evalution.
evaluation_frequency	biweekly	The time discretization.
shocked_yield_start	0	The start of the shocked yield range.
shocked_yield_end	0.1	The end of the shocked yield range.
shocked_yield_delta	0.005	The yield step of the shocked yield range.
bonds_params_file_path_from_dataspace	bonds.txt	The relative path from the dataspace of the bond params file following the tsv format.

Parallelization

nb_replicated_tasks	2	The number of ProActive replicated tasks, each having in charge a cubelet, i.e. a subset of the senarios.
nb_replicated_tasks_per_cubelet	2	The number of ProActive replicated tasks, each having in charge a cubelet, i.e. a subset of the instruments.

Hardware Resources

node_source_compute_memory_intensive_exclusive	○ TRUE ◉ FALSE	Exclusive usage or not of the targeted node sources.
node_source_compute_intensive		Name of the targeted node source dedicated to compute intensive tasks.
node_source_memory_intensive		Name of the targeted node source dedicated to memory intensive tasks.

Others

data_dir_path	/tmp	The path of the output files.

Mark_to_Future_cube_stats.xml

Splits the scenarios and bonds over the replicated tasks

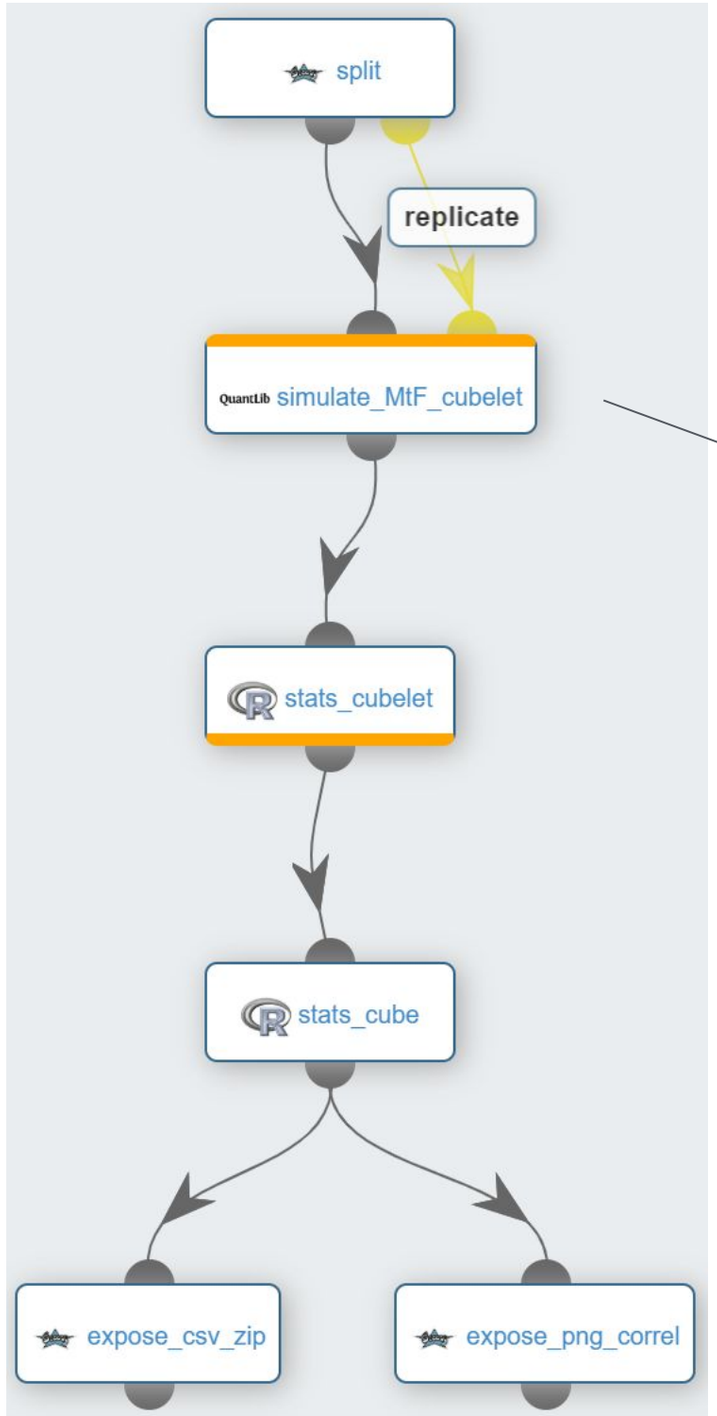
1st level of replicated tasks: a replicated task per subset of scenarios

Each replicated task pulls from the catalog and submits the cubelet simulation workflow

Computes the portfolio clean prices per scenario and per evaluation date (cubelets)

Merges the portfolio clean prices into a single csv file (cube). Computes portfolio prices time series for each scenario and creates a csv file. Computes correlations over scenarios and creates a csv file + heat map png file

Allows user to visualize/download the png/csv zip files

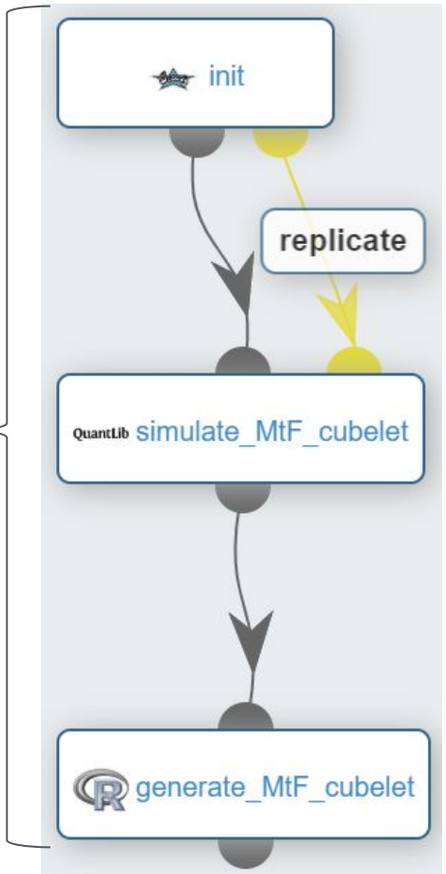


Init parameters

2nd level of replicated tasks: a replicated task per subset of bonds

Using Quanlib, each replicated task estimates a subset of the portfolio clean prices (cubelet)

Merges cubelets (bonds -> portfolio) and creates a csv file



Mark_to_Future_cube_stats.xml
